

#### SMALL HYDRANT WITH TIE Ø 30

As a result of the large diffusion of low pressure sprinklers, it has been necessary the application of special hydrants: the hydrants with tie. The advantage of this type of small hydrant is given by the possibility of connecting it easily on movable pipes, by means of the appointed supporting snap(tie), obtaining a strong connection to the pipe.

This model is available in two versions: normal, requiring the relative closing cap or with automatic valve which determines opening and closure by the setting or removing of the sprinkler-holder rod. It is built for the following diametres:

Ø 60 mm.

Ø 80 mm.

Ø 100 mm.
